StrideSet – Stage 2 Quality Check

I walked through each main flow as a first-time user (start and finish a workout, start and finish a run, view the calendar, change settings) and checked the screens against the core features from our Stage 1 plan and a usability/accessibility checklist (clarity, number of steps, navigation, consistency, feedback, error recovery, text size, contrast, touch targets, color use).

Severity	Meaning
High	Blocks a core task or a core feature is missing.
Medium	Causes confusion or mistakes, or makes a flow untestable.
Low	Polish, does not stop the user from completing a task.

What works well

- The layout is clean and minimal, which matches our main design principle ("no unnecessary bloat").
- The Run screen shows time, distance and pace in large, readable numbers.
- Screens follow a consistent structure: title at the top, main action at the bottom.
- Completion screens confirm that data was saved ("Saved", "Easy run saved"), which gives clear feedback.
- In Settings, the selected option is shown with a filled dot, bold text and a background, not by color alone.

Usability findings

ID	Screen	Finding	Severity	Suggestion
U1	Workout	"+ Add exercise" does nothing, so exercises cannot be added to a workout. Blocks the core gym logging flow.	High	Open an exercise picker with search and a "Create custom exercise" option.
U2	Workout	No screen for entering weight and reps per set. Exercise rows only show "3 sets".	High	Tapping an exercise opens a set-logging view: weight, reps, mark set as done, previous result shown.
U3	Home / Workout	"Start workout" opens fixed exercises. There is no way to create, save or choose a workout plan.	High	Let the user pick a saved plan or start an empty workout. Add a simple plan editor screen.
U4	Whole app	The progressive-overload recommendation is not	High	Show the suggestion in the set-logging

		shown anywhere. It is a core feature and a Stage 1 success metric.		view, e.g. "Last: 3 x 8 at 60 kg, try 62.5 kg", editable by the user.
U5	Settings	Unit options (km/miles, kg/lb) cannot be selected, so the settings flow cannot be tested.	Medium	Make the options interactive and show the selected state.
U6	Workout, Run	No way to pause, cancel or leave a workout or run without finishing it.	Medium	Add Pause to the Run screen and a "Discard" option with confirmation to both screens.
U7	Workout, Run	"Finish workout" and "End run" end the session immediately. One accidental tap ends it.	Medium	Add a confirmation dialog.
U8	Workout complete, Run complete	"Back" is ambiguous: it is unclear whether it returns to the finished session or to Home.	Low	Rename it to "Done" and return to Home.

Accessibility findings

ID	Screen	Finding	Severity	Suggestion
A1	Calendar	The month arrows (‹ ›) are very small.	Medium	Touch targets should be bigger.
A2	Calendar	Days with activities are marked only by a tiny dot next to the number, which is easy to miss.	Medium	Use a larger dot or a filled circle under the date.
A3	Bottom navigation	Navigation is text only, the active tab is shown with brackets and the tap areas are small.	Low	Use clearer indication, buttons or icons.

Edge cases and system states

The prototype shows success states (the "Workout complete" and "Run complete" screens) but no empty, loading, error or validation states yet.

ID	Flow / Screen	Situation	Expected behavior
E1	Home, Calendar	No workouts or runs saved yet, or the selected day has no activities.	Show a message ("No activities yet" / "No activities on this day") with a button to start a workout.

E2	Workout	The user finishes a workout with no exercises or no completed sets.	Ask "Discard empty workout?". An empty workout is not saved.
E3	Set logging	Weight or reps is empty, zero, negative or not a number.	Numeric keyboard only. Show an error message and do not save the set.
E4	Custom exercise	The exercise name is empty or already exists.	Show an error message next to the field. The exercise is not saved.
E5	Progressive overload	The exercise has no previous data, or the last session was not completed.	No data: show "Log this exercise once to get a suggestion". Not completed: do not increase the weight. The user can always change it.
E6	Run	Location permission is denied.	Explain why location is needed and offer a button to open settings.
E7	Run	GPS signal is weak or still searching when the run starts.	Show "Searching for GPS...". Distance starts counting once a signal is found.
E8	Workout, Run	The app is closed, the phone is locked or a call comes in during a session.	The session keeps running and the timer is correct when the user returns.
E9	Calendar, Saving	Data is loading, or saving a workout or run fails.	Show a short loading indicator. On failure show an error message with Retry. Data is never silently lost.
E10	Settings	Units are changed after data already exists.	All existing workouts and runs are shown in the new unit, correctly converted.

Acceptance criteria

The criteria are based on the prototype, the core features and the success metrics from our Stage 1 plan.

ID	Feature	Acceptance criteria
AC1	Workout logging	• Entering weight and reps and marking a set as done shows the set immediately. • Sets can be edited and deleted during the workout. • After "Finish workout" is confirmed, the workout is saved with date, duration, exercises and sets, and appears in the calendar. • Saved workouts are unchanged after restarting the app. • Invalid input shows an error and is not saved.

AC2	Workout planning	• The user can create a plan with a name and exercises with target sets and reps. • Plans can be edited and deleted. • Starting a workout from a plan fills in its exercises. • A plan cannot be saved without a name or exercises.
AC3	Custom exercises	• The user can create an exercise with a name and type. • The new exercise is immediately available in the exercise picker and in plans. • Empty or duplicate names are rejected with a message.
AC4	Progressive overload	• If the exercise has been logged before, a suggestion for the next session is shown. • The previous result is shown next to the suggestion. • The suggestion follows the rule: “all target reps done - small weight increase, otherwise same weight” • The user can ignore or change the suggestion. What the user enters is saved. • Without previous data, a message is shown instead of a suggestion.
AC5	Run tracking	• Starting a run asks for location permission if it has not been given. • Elapsed time, distance and pace update every few seconds during the run. • Tracking continues when the screen is locked or the app is in the background. • After "End run" is confirmed, the run is saved with date, duration, distance and pace, and appears in the calendar. • Missing permission or GPS signal gives a clear message.
AC6	Calendar / history	• Days with activities are clearly marked. • Selecting a day lists its workouts and runs with a short summary. • Tapping an activity opens its details. • A day without activities shows a message.
AC7	Settings	• The user can switch between km/miles and kg/lb. • The choice is kept after restarting the app. • All screens show values in the selected unit.
AC8	Performance	• Local actions (open a workout, add a set, save an exercise) respond within about 500 ms. • Actions using the external API complete within about 2 seconds on a stable network.

Test scenarios

T1-T4 are the four main workflows from our Stage 1 success metrics.

ID	Scenario	Steps	Expected result	Covers
T1	Create a workout plan	Create a plan "Push day" with Bench press (3 x 8). Create a custom exercise "Cable fly" and add it. Save.	The plan is saved and shown in the plan list. The custom exercise can be found in the exercise picker.	AC2, AC3
T2	Log a gym workout	Start a workout from "Push day". Log 3 sets of Bench press at 60 kg x 8. Edit one set. Finish and confirm. Restart the app.	The summary shows the correct sets and weight. The workout appears in the calendar on today's date and is unchanged after the restart.	AC1, AC6
T3	View the progressive overload suggestion	After T2, start "Push day" again and open Bench press. Change the suggested weight.	The previous result (3 x 8 at 60 kg) and a suggestion are shown. The changed value is the one saved.	AC4
T4	Start and complete a run	Home > Start run. Allow location. Walk or run for a few minutes. End the run and confirm.	Time, distance and pace update during the run. The summary shows the values and the run appears in the calendar.	AC5
T5	Find a past activity	Open Calendar. Select a marked day and tap an activity. Then select a day with no activities.	The correct activities are listed and the details open. The empty day shows a message.	AC6, E1
T6	Change units	Settings > select miles and lb. Open a past run and workout. Restart the app.	Values are shown in miles and lb, correctly converted. The setting is kept after the restart.	AC7, E10
T7	Invalid set input	During a workout, leave reps empty, then enter "-5" as weight, and try to save the set.	An error message is shown and the set is not saved.	AC1, E3
T8	Location permission denied	Start a run and deny location permission.	A message explains why location is needed and offers to open settings.	AC5, E6

T9	Interrupted session	Start a workout and log one set. Lock the phone or switch apps for 1 minute. Return to the app.	The workout is still in progress with the logged set, and the timer shows the correct time.	AC1, E8
T10	First time on an exercise	Open an exercise that has never been logged.	A "No previous data" message is shown instead of a suggestion.	AC4, E5
T11	Response time	Open a saved workout, add a set and save a custom exercise. Then end a run (uses the running API). Time each action.	Local actions respond within about 500 ms. The run API actions complete within about 2 seconds on a stable network.	AC8

Usability review summary

We carried out a short usability review of the clickable prototype with 3 participants who were not involved in the design. Participants described the layout as very clean and simplified, which supports our main design principle of a minimal app without unnecessary features. The main problems reported were that the bottom navigation bar is too small, that most buttons don’t work yet in the prototype, and that the calendar interface is small. These results match our own review findings: the small navigation and calendar elements (A1–A3) and the non-functional buttons (U1, U5). The findings have been passed to the Design Leads.
